Language support

This page lists all languages supported by Cloud Speech-to-Text. Language is specified within a recognition request's `languageCode` parameter. For more information about sending a recognition request and specifying the language of the transcription, see the how-to guides about performing speech recognition. For more information about the class tokens available for each language, see the class tokens page.

Try it for yourself

If you're new to Google Cloud, create an account to evaluate how Speech-to-Text performs in real-world scenarios. New customers also get $300 in free credits to run, test, and deploy workloads.

Try Speech-to-Text free
The table below lists the models available for each language. Cloud Speech-to-Text offers multiple recognition models, each tuned to different audio types. The **default** and **command and search** recognition models support all available languages. The command and search model is optimized for short audio clips, such as voice commands or voice searches. The default model can be used to transcribe any audio type.

Some languages are supported by additional models, optimized for additional audio types: **phone call**, **enhanced phone call**, and **enhanced video**. These models can recognize speech captured from these audio sources more accurately than the default model. See the enhanced models page for more information. If any of these additional models are available for your language, they will be listed with the **default** and **command and search** models for your language. If only the **default** and **command and search** models are listed with your language, no additional models are currently available.

Use only the language codes shown in the following table. The following language codes are officially maintained and monitored externally by Google. Using other language codes can result in breaking changes.

Filter on supported features:

(add spoken punctuation)   (word-level confidence)
(add spoken emojis)   (automatically add punctuation)
                              (automatically detect different speakers)
                              (customized word recognition)
